

# CCDC: Centre for Crop Disease Control

Team name: NEUON AI

Members: Chang Yang Loong, Sophia Chulif, Heng Kiat Jing, Danish Ezwan

# Our focus

# Agriculture

# Introduction

Crops make up  
the vast majority  
of agricultural  
production

Farmers depend  
on healthy crop  
yield

Crop diseases  
result in the loss  
of crop yield and  
income

# Problem statement

1. How can we create a sustainable farming solution?
2. How can we empower rural farmers to utilize data mining to improve their farm's efficiency while at the same time lowering their farm operating cost?

# Importance of crop disease recognition

- + Enable curative measures
- + Prevent spread of disease
- + Reduce crop loss
- + Prevent recurring outbreaks in the future

# Existing problems

Unavailability of human expertise  
e.g. plant pathologist in rural farm

Outbreak and spreading of disease from slow crop disease detection

# Solution

Plant  
expert  
knowledge

Machine

Crop disease  
recognition  
assistant

# How it will solve

Introduce a collaborative platform

Assist smallholder farmers without research infrastructure or support

Enable timely control response

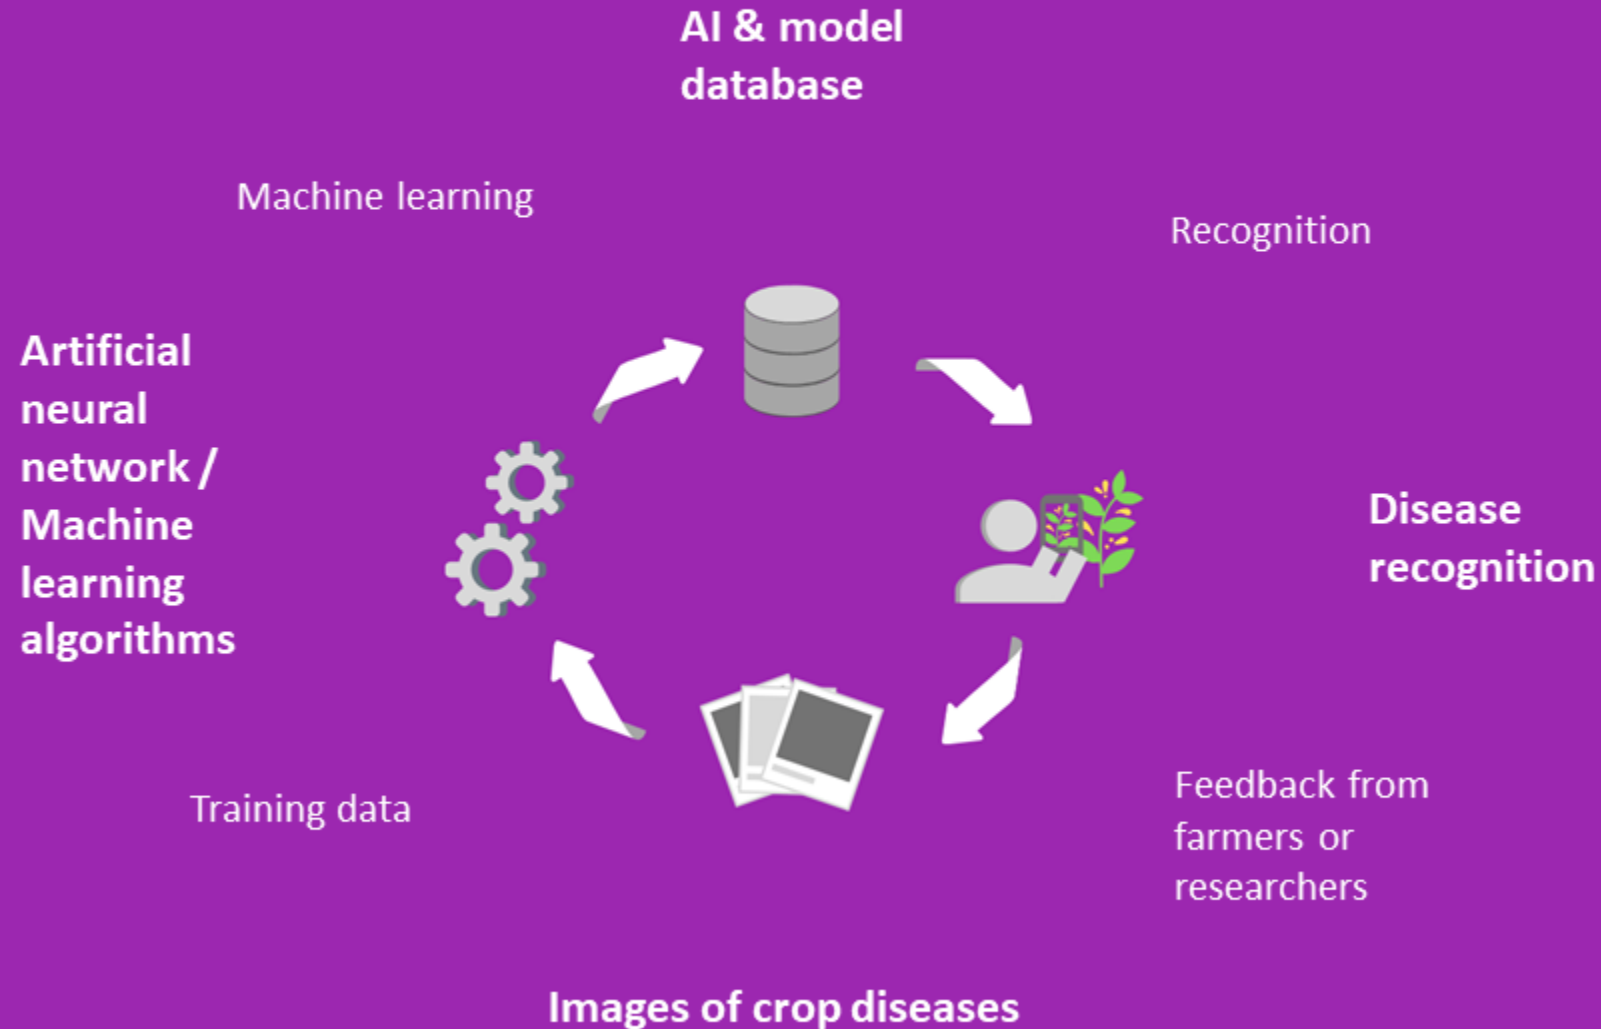

# Technical challenges

- Existing plant disease data is not region invariant
- Data required for deep learning task is large
- Data needs to be diverse in terms of capturing condition, disease stages and image quality

# Centre for Crop Disease Control

# Methodology

# Features

## Recognise disease

- Using AI model
- Deploy on app

## Manage disease data

- Annotate
- Store

## Sharing / community platform

- Share diseases detected
- Help to identify cause
- Predict spreading magnitude
- Enable timely response from authorities

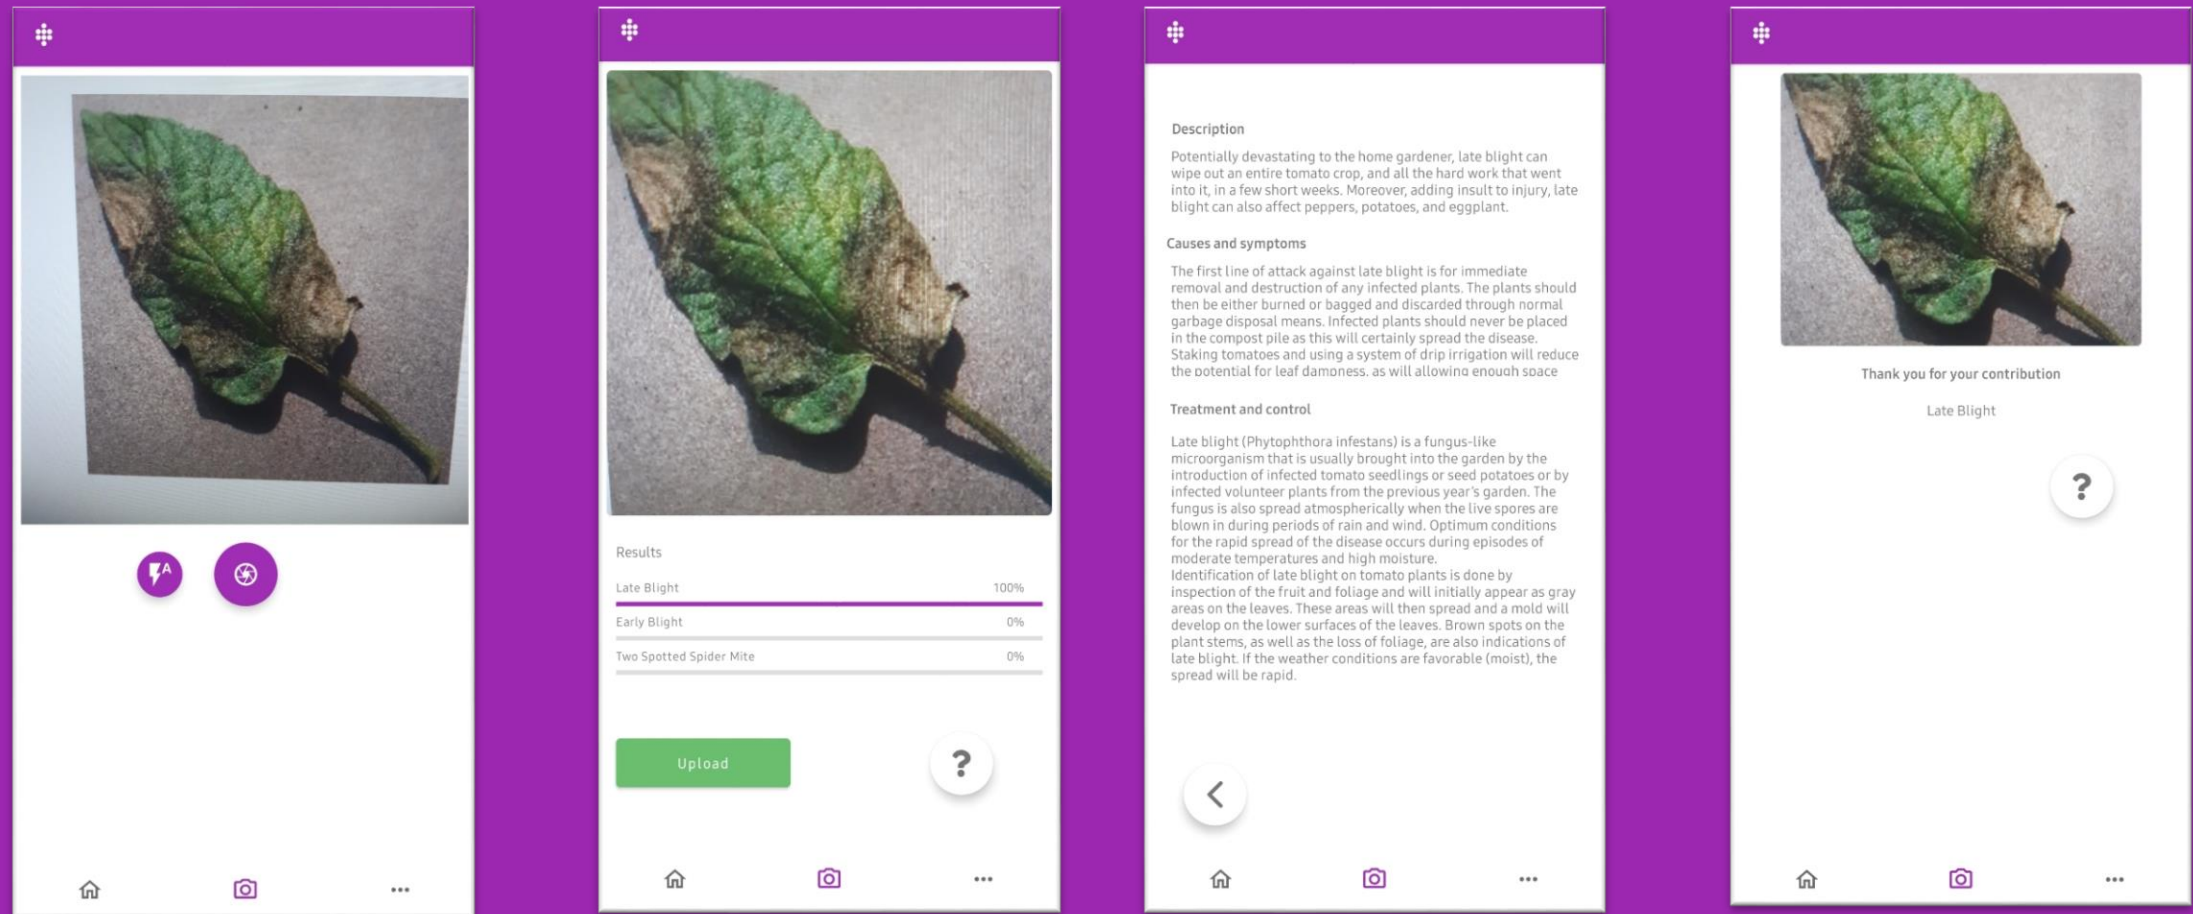

# Prototype

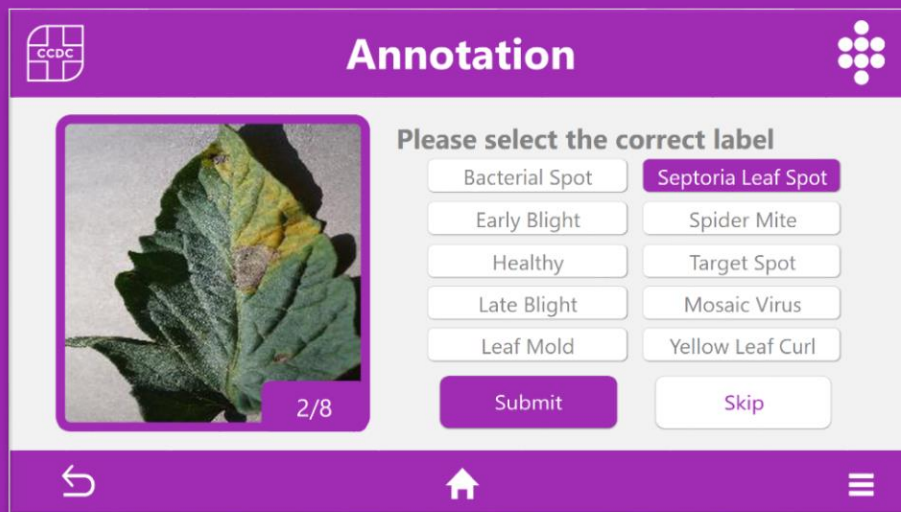

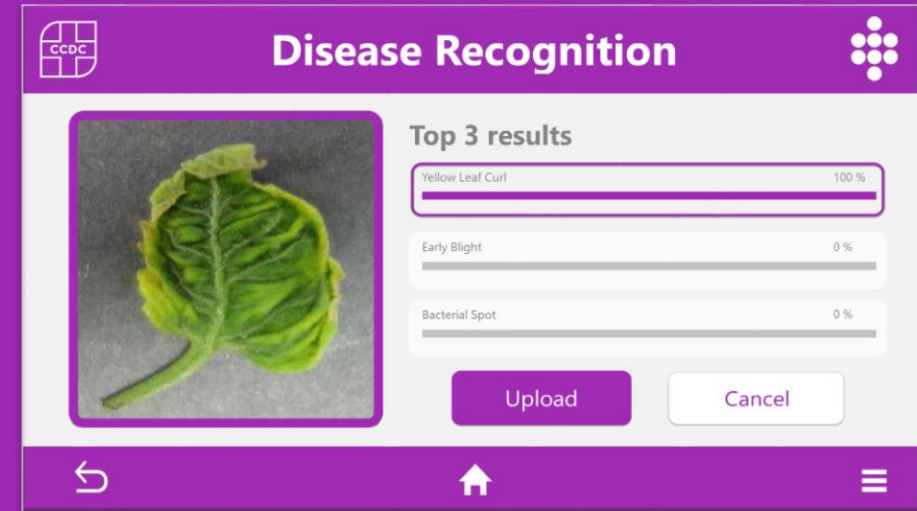

Automated tomato plant  
disease recognition system

# Prototype UI (Android App)

# Prototype UI (Windows PC)

# Notable outcomes

- A reliable and continuously learning AI for crop disease

# Notable outcomes

- Reduce the cost of data collection by crowdsourcing the community

# Notable outcomes

- Early detection of crop disease
  - Increase of production quality & quantity
  - Increase of farmer and State income

# Notable outcomes

- Study, analyse, detect and control crop disease outbreak with the collaboration of agricultural authority within the community

\* Potential authorisation bodies

# Notable outcomes

- Light-weight and independent AI model for offline disease detection

# Conclusion

Sustain for research purposes & future generations

Increase quality yield

Reduce crop loss

Adopt timely response

Practical

# Trained model results

Accuracy	Model	
	1 (Mobile Net v2)	2 (Inception Resnet v2)
Training (Top 1)	88.13 %	96.88 %
Validation (Leaf Scan - Top 1)	97.94 %	99.75 %
Validation (Non-leaf Scan - Top 1)	64.44 %	78.89 %
Validation (Leaf Scan - Top 3)	99.92 %	100.00 %
Validation (Non-leaf Scan - Top 3)	93.33 %	91.11 %
